The Educational Beliefs of Pre-Service Teachers as an Important Predictor of Teacher Identity

Eray Eğmir¹*, Sevcan Çelik¹
¹Afyon Kocatepe University

Abstract

This study aims to determine the relationship between the educational beliefs and teacher identity of pre-service teachers from all grade levels of four different departments at Afyon Kocatepe University. Besides, to what extent the educational beliefs predict their teacher identity is also examined. The research is conducted using the correlational survey model. The sample of the study consists of 324 pre-service teachers who are studying in all grades at Afyon Kocatepe University. In the data collection process, “Education Belief Scale” developed by Yılmaz, Altinkurt and Çokluk (2011) and “Early Teacher Identity Measure” developed by Friesen and Besley (2013) and adapted into Turkish by Arpacı and Bardakçı (2015) is used. In line with the findings, the pre-service teachers’ dominant educational philosophies are identified as existentialism, progressivism, reconstructionism, perennialism, and essentialism, respectively. There is a significant and positive relationship between educational beliefs and teacher identities, except for essentialist belief. The results suggest that the pre-service teachers' educational beliefs and teacher identities differ significantly in terms of gender, grade and department variables. Additionally, while the prediction model is significant, progressivist educational belief is found out to be the most important dimension in the model that explains the teacher identity. These four educational beliefs, together, account for 23% of the change in teacher identity level of pre-service teachers.

Key words: Teacher identity, Educational beliefs, Pre-Service teachers.

Introduction

Nowadays, theories in which the student is taken to the center in educational environments are put to work. The principles of these theories include giving importance to the interests, needs, attitudes and educational beliefs of the individual who will gain knowledge, skills or competence through teaching and learning processes. Especially, because of the view that beliefs are a major factor affecting the quality and outcomes of the educational process, more researchers focus on belief and concepts related to this concept in the educational literature.

One of the most powerful factors in the formation and emergence of behavior is the belief of an individual (Bandura, 2006). Belief can be defined as the processes and qualifications aimed at perceiving, interpreting, evaluating, and determining the attitudes and tendencies of an individual about the situation, phenomena, and concepts that the individual encounters during his/her life (Deryakulu, 2008). Researchers define the concept of belief as a structure composed of emotion, behavior, and tendency components towards objects and events and place beliefs on the basis of attitude formation (Hogg & Vaughan, 2005). Attitude is the preparatory tendencies that involve the regular and coherent roles of mental, affective, and behavioral expressions of an individual towards an object (Kağıtçibaşı, 2010).

Beliefs that are adopted by teachers in education include elements such as methods and techniques used in conducting educational activities, theoretical foundations of approaches in the learning environment, competent communication with students, and systematic classroom management (Çapa & Çil, 2000). When all these components come together, teachers' educational philosophies come into being. Determining their beliefs about education, which is one of the important drivers of quality in education, is thought to be an important initiative in order to increase the quality of education and training activities.

With the developments in the information age, the opportunities in the process of access to information have increased and diversified. This situation has brought about important improvements in education, such as the more effective and active participation of students in the teaching process and in structuring information. The teacher who is an important factor in ensuring the adaptation of individuals has important tasks at this stage (Karahan, 2003). According to Varış (1994), the success of an education system depends on the beliefs and attitudes of teachers in terms of cognitive, affective, and dynamic aspects and the coordination between them. According to Carter and Norwood (1997) and McDiarmid (1990), knowing the educational beliefs of teachers and pre-service teachers is the first step towards improving the quality of education and understanding the values and beliefs of those involved in carrying out these processes (cited by Bulut, 2009).

Education, which has been described in different ways by philosophers and educators in the historical process, has always had a philosophical perspective. In the field of education, as in other intellectual fields, philosophy evaluates the underlying concepts of educational systems, brings educational approaches together in a rational way and disciplines assumptions, beliefs, and decisions according to meaning and consistency criteria (Cevizci, 2012). It is possible to explain all dimensions of education and the functions and actions between these dimensions with the philosophy of education. Educational philosophies, which are at the center of curriculum development and evaluation activities, are a phenomenon that affects all the dimensions making up the curriculum within the ideological framework. Educational philosophies classified according to various criteria can be categorized roughly as traditional/contemporary or rigid/flexible (Kılıç, 2000).

Perennialism which is predominantly based on realistic and idealistic philosophy perceives the universe in a spiritual form because it attaches importance to metaphysics and absolute values, and it reveals the position of man in the universe spiritually. According to the perennialist, the only truth is mind, and all material things that must be real can be reduced to mind or soul (Brauner & Burns, 1982). The process of knowing takes place in the form of remembering or defining the pre-existing, formed, and perpetual concepts in idealism. Therefore, school is a social institution established to develop the potential of the human mind (Gutec, 2001).

Essentialism, on the other hand, is based on realist and idealist philosophies as an educational philosophy claiming that man as a social being has a standard essence and is not endowed with any innate knowledge. In terms of essentialist philosophy, the aims of education are to develop the mind and will of the human being, to ensure that the rules of the mind are used correctly and effectively, and to educate the individual according to ideal and universal realities. According to the essentialism assuming that information is obtained through induction, the most important mission of the school is to teach the individual intellectual disciplines and thus to ensure the continuity of cultural heritage (Cevizci, 2012).

According to progressivism which is based on John Dewey pragmatism, education is a social work done to make an individual competent, strong, and productive in society. The pragmatists who claim that education is not a result but a process of life itself argue that the content should be structured in integrity with human nature and environment and with purposeful experiences selected considering the interests of individuals. In a democratic environment, a cumulative process must prevail in the learning environment intended to be realized through actions and experiences (Kaplan, 2008). Additionally, real problems should be reflected in the educational environment, and all kinds of courses representing the whole life should be included in the program.

In re-constructionism, which is also called social restructuring, active participation of the individual's to learning environment is a result of the knowledge-based learning based on the mental activities. Restructuring which is based on reinterpreting, structuring and transferring existing knowledge claims that the learned knowledge should be a tool for solving problems in actual life (Doğanay & Sari, 2003).

According to existentialism, which is a modern philosophical movement, the aim of education is to accustom man to the existing world. In existentialism where absolute or aristocratic subjectivism is involved in the teaching and learning process, the individual prepares himself/herself for both success and failure during the education process. Moreover, according to existentialism, students demonstrate the ability freely to express their learning processes in line with their abilities and interests (Kop, 2004). Although a continuous program is not mentioned in the existentialist philosophy, the curriculum design in the concept of existentialism is put forward flexibly according to the needs of the educational unit level and the characteristics of the students.

In the light of these explanations, it can be said that one of the important factors affecting the teachers’ direct and indirect fulfillment of their roles and responsibilities in the context of educational activities is their philosophical orientation or preference. Nevertheless, the attitude towards teaching profession is an important factor in conducting it. The educational philosophies of teachers consist of ontological, epistemological and
axiological components. Ontologically, teachers have an orientation towards the relationship between teacher and student in educational settings and the roles of each other. Besides, teachers have thoughts about which type of knowledge has priority and what values should be conveyed in the education process and all these elements come together to form the beliefs of teachers.

The positive attitudes and beliefs of the individuals who will perform the teaching profession are the prerequisites for fulfilling the requirements of the profession in the most effective way. The positive attitude towards the profession also supports the commitment level of the teacher identity (Baydar & Bulut, 2002). It is possible for the teacher, who is one of the most important stakeholders in the continuation of education and training practices, to provide learning and teaching environment that supports the content targeted for the curriculum by being aware of the needs of his/her professional identity (Semerci & Semerci, 2004).

The teacher who is the representative of the concept of learning, which is considered as an interaction process, draws attention with the definition of 'authority figure' in line with the related literature. The teacher who is obliged to carry out his/her professional activity and to provide the necessary conditions for the success of the teaching process has many roles such as family member, counselor, boss, learning guide, professional expertise, judge, guide or therapist (Bozdoğan, Aydın & Yıldırım, 2007). When we are to place teachers’ attitudes about their roles on classroom activities in a student-centered way, we end up seeing duties such as encouraging the students and planning in-class or out-of-class activities (Ora, 2004). Considering all these rankings, the teacher's actual identity, professional attitude and identity to adopt roles parallel to the relevant norms and values can only be associated with the philosophy of education which is considered only when carrying out educational activities (Bulut & Doğar, 2006).

Importance of Research

In line with the literature reviewed, it is possible to state that the philosophy of education adopted by teachers and pre-service teachers occupies a great place in the formation of teacher identity. Teachers’ commitment to their profession and social awareness of their profession are necessary and important to reach positive perception about their roles and believe that they have to constantly improve themselves (Temizkan, 2008). This research is important and necessary for the purpose of explaining the predictable dimensions of the relationship between pre-service teachers' educational beliefs and teacher identities. Furthermore, it is assumed that it can be a model in the related field with the benefit and usefulness it will bring to the literature. This model will attempt to clearly determine the impact of each of the educational philosophies on the belief in education and thus reveal the internal relationship between these two structures. With this model, it will be possible to determine which educational philosophy should be focused on in order to make educational belief positive and effective.

Problem Statement

Thus, the study investigated whether there was a significant relationship between the educational beliefs and teacher identity of pre-service teachers. Furthermore, it examined the education beliefs and level of the teacher identity of pre-service teachers, and also, the effects of some demographic variables on these two concepts.

Method

Research Design

The research was conducted using the correlational survey model. The correlational survey model is important to reveal relationships between variables and to determine the levels of these relationships (Karasar, 2016, p. 114). Moreover, the correlational survey provides the necessary clues for conducting more complicated investigations on a relationship (Büyüköztürk, Kılıç Çakmak, Akgün, Karadeniz & Demirel, 2013, p. 185). This study tried to determine the relationship between the educational beliefs and teacher identity of pre-service teachers from all grade levels of four different departments at Afyon Kocatepe University. Besides, to what extent the educational beliefs predicted their teacher identity was also examined. The sub-problem of the study was whether these two concepts differed significantly in terms of gender, grade level, and department variables.

Participants

The sample of the study consisted of 324 pre-service teachers who were identified through convenience sampling in all grades at Afyon Kocatepe University. The distribution of the determined sample according to some variables is presented in Table 1.

Data Collection Tool

In the data collection process, “Education Belief Scale” developed by Yılmaz, Altınıkurt and Çokluk (2011) was used to determine which educational philosophy pre-service teachers predominantly conceptualized. The scale was a five-point Likert-type scale with a total of 40 items. The scale consisted of five factors: “Progressivism”, “Existentialist Education”, “Re-constructionism”, “Perennialism”, and “Essentialism”. For the reliability of the scale, Cronbach Alpha internal consistency coefficients calculated for Educational Belief Scale’s dimensions varied between .70 and .91 (Yılmaz, Altınıkurt & Çokluk, 2011). In the present study, the Cronbach Alpha coefficients of the dimensions varied between .71 and .88. These values were considered to be highly reliable for the scale to be used in the present research (Tavşancıl, 2006, p. 29).

Besides, “Early Teacher Identity Measure” developed by Friesen and Besley (2013) and adapted into Turkish by Arpacı and Bardakçı (2015) was used to obtain the teacher identity level of the pre-service teachers. The scale was a five-point Likert-type scale which had a single factor with a total of 17 items. As a result of factor analysis, it was seen that the scale items explained 48.94 % of the variance. For the reliability of the scale, Cronbach Alpha internal consistency coefficients based on item analysis was .93 for the whole scale (Arpacı & Bardakçı, 2015). In the present study, the Cronbach alpha coefficient for the whole scale was calculated as .91.

Data Analysis

The data obtained from the scales were analyzed using SPSS statistical program. In order to determine the educational beliefs and level of teacher identity of the pre-service teachers, mean of their responses was calculated. Then the normality test was performed to determine whether the data related to educational beliefs and teacher identity of pre-service teachers demonstrated a normal distribution. First, Kolmogorov Smirnov test was used because the size of the sample is greater than 35 (McKilup, 2012). The values obtained from Kolmogorov-Smirnov test were significant for the sample. However, Field (2009) stated that to calculate z-scores related to skewness and kurtosis coefficients gives more reliable results for determining the normality because Kolmogorov-Smirnov test show a conservative structure. According to z-scores the data showed a normal distribution related to educational beliefs and teacher identity of pre-service teachers. So, a group of statistical analyses were conducted as follows:

- Independent samples t-test to determine whether the pre-service teachers’ educational beliefs and teacher identity showed a significant difference in terms of gender;
- One way ANOVA test to determine whether the pre-service teachers’ educational beliefs and teacher identity showed a significant difference in terms of grade and department variables;
- Pearson correlation test was conducted to determine whether there was a significant correlation between the pre-service teachers’ educational beliefs and teacher identity;
- Multicollinear regression test to determine whether the pre-service teachers’ educational beliefs significantly predicted their teacher identities.

Findings

In the first problem of the study, means of the responses to the whole scale and dimensions were calculated in order to determine the level of the pre-service teachers’ educational beliefs and teacher identity. The mean scores are shown in Table 2.

</tbody>
</table>

When the findings in Table 2 were examined, it can be stated that the pre-service teachers showed the highest participation in the belief in existential education. Moreover, the pre-service teachers showed participation in the belief in progressivism at “totally agree” level and in re-constructionism and perennialism at “agree” level. However, the pre-service teachers showed a participation in the belief in essentialism at “undecided” level. It can be stated that the items of the scale related to essentialism often emphasize the teacher's authority and punishment. In spite of this, while the perennialist educational philosophy is a conservative philosophy, too, the items of the scale related to perennialism emphasize values education and the development of reasoning. So, the teacher candidates had a higher level in perennialist education belief than essentialist one.

When the dominant education belief of the pre-service teachers was examined, most of pre-service teachers showed participation in the belief in existential education (n=225). This is followed by the belief in progressivism (n=83), re-constructionism (n=38), perennialism (n=34), and essentialism (n=19) respectively. Also, the pre-service teachers’ teacher identity levels were found to be at “agree” level. So, it can be said that the pre-service teachers had a high teacher identity level.

In the second problem of study, it was investigated whether educational beliefs and teacher identity differed significantly in terms of gender, grade, and department variables. First, the results related to gender are shown in Table 3.

*p<.05  ** Equal variances not assumed

When the findings in Table 3 are examined, it can be said that the pre-service teachers’ all educational beliefs and teacher identity level differ significantly according to gender. It can be stated that the means determined in all dimensions are higher in favor of the female pre-service teachers except essentialist belief. In other words, the male pre-service teachers tend to participate in essentialist belief more than the female pre-service teachers. Also, the female pre-service teachers’ teacher identity levels are higher than the male pre-service teachers.

In the third problem of the study, it was investigated whether educational beliefs and teacher identity differed significantly according to grade. The results of one way ANOVA test are shown in Table 4.

*p<.05

When the data in Table 4 are examined, it can be said that the pre-service teachers’ all educational beliefs and teacher identity level differ significantly according to grade. It can be stated that the means determined in all dimensions and teacher identity are higher in favor of higher grade pre-service teachers except essentialist belief. In other words, as the grade increases, the teacher identity and educational beliefs of the pre-service teachers except essentialism are increasing.

After that, it was investigated whether educational beliefs and teacher identity differed significantly according to department. The results of one way ANOVA test are shown in Table 5.

IJCER (International Journal of Contemporary Educational Research) 443
When the data in Table 5 are examined, it can be said that the pre-service teachers’ progressivism, existentialism, and essentialism educational beliefs and teacher identity level differ significantly according to department. It can be stated that the means determined in teachers’ progressivism and existentialism educational beliefs and teacher identity values are higher in favor of pre-school pre-service teachers than social sciences and mathematics pre-service teachers. Also, pre-school pre-service teachers’ teacher identity levels are higher than primary school pre-service teachers. In essentialist belief, social sciences and primary school pre-service teachers’ beliefs are higher than pre-school pre-service teachers.

After that, it was investigated whether there was a significant correlation between educational beliefs with teacher identity. The results of Pearson correlation test are shown in Table 6.

When the results in Table 6 are examined, it can be said that there is a significant and positive correlation between the pre-service teachers’ educational beliefs and teacher identity except essentialism. The highest correlation is found between teacher identity and existentialist belief (r=.481; p<.01), and the lowest one is found between teacher identity and essentialist belief (r=-.181; p<.01). All correlation coefficients are found to be significant.

After that, multiple regression analysis was conducted to determine whether teachers’ educational beliefs significantly predicted their teacher identities. The results of the analysis of variance related to regression analysis are shown in Table 7.

When the Table 7 is examined, it can be stated that the model established for the prediction of the teacher identity of the pre-service teachers by the progressivism, existentialism, re-constructionism, and perennialism educational beliefs is meaningful (F(4,315)=23,971; p<.01). After that, the findings of multicollinear regression analysis between the education beliefs and teacher identity concept were given in Table 8.

R=.483; R²=.233; F(4,315)=23,971; p<.01
According to the analysis, while the model is significant as a whole [F(4,315)=23.971; p<0.01], progressivism educational belief (β = .253) is found out to be the most important dimension in the model that explained the teacher identity. These four variables, together, account for 23% of the change in teacher identity level of the pre-service teachers. The relative order of importance of the dimensions in the regression model is seen as existentialism (β = .245) and perennialism (β = .165) educational beliefs. These education beliefs were found out to be satisfactorily significant. Besides, re-constructionism (β = .164) educational belief was found to be significant but non-linear for the prediction of teacher identity. This suggests that teacher identity level of pre-service teachers is strongly explained by education beliefs such as progressivism, existentialism, and, perennialism.

According to the findings, regression equation of pre-service teachers' teacher identity was as follows:

Teacher Identity=21,368+0,253*Progressivism+0,245*Existentialism+0,165*Perennialism-0,164*Reconstructionism

Discussion and Conclusion

A portion of the research conducted in Turkey about educational beliefs were aimed at determining teachers’ and pre-service teachers’ educational philosophies and beliefs (Altunkurt, Öğuz & Yılmaz, 2012; Çetin, İlhan & Arslan, 2012; Doğanay, 2011; Doğanay & Sari, 2003; Ekiz, 2005; 2007; Geçici & Yapıcı, 2008), and some of them were related to associating educational beliefs with various variables. For example, there are studies in the literature about teachers’ and pre-service teachers’ educational philosophy and learning styles/strategies (Duman, 2008); epistemological beliefs and attitudes towards teaching profession (Önen, 2011); teacher-student relations (Yılmaz & Tosun, 2013); teaching strategies (Coban, 2002); and, effective teacher behaviors and beliefs about classroom management (Okut, 2011). This study investigated the relation between pre-service teachers’ educational beliefs and teacher identity and the extent to which teacher identities of pre-service teachers were predicted by their educational beliefs. The study also tried to determine whether these two variables differed significantly in terms of gender, grade, and department variables.

In line with the findings, the pre-service teachers’ dominant educational philosophies were determined as existentialism, progressivism, re-constructionism, perennialism, and essentialism, respectively. From this point of view, it can be stated that pre-service teachers prefer existentialism and progressivism in which the individual's and society's interests, needs, and expectations are taken into consideration rather than the philosophies of perennialism and essentialism that emphasize the traditional understanding in education. On the other hand, in the study, it was determined that the pre-service teachers were more involved in the philosophy of perennialism which emphasized culture transfer and values education rather than the essentialist philosophy emphasizing teacher's authority, memorization and repetition processes, and strict discipline. In Yılmaz and Tosun's (2013) research in which teachers adopted the most existential, progressive, perennialist, re-constructive and essentialist educational philosophies respectively coincides with the findings of the research.

When other studies conducted on different sample groups are examined, it is seen that the educational philosophies adopted by the teachers differ slightly, but in general, the findings of the current research show similarities. In the other studies (Altunkurt et. al., 2012; Ilgaz, Bülbül & Çuhadar, 2013; Koçak, Ulusoy & Önen, 2012; Öğuz, Altunkurt, Yılmaz & Hatipoğlu, 2014; Sahin, Tuna & Ülubey, 2014; Üğürlu & Çalışmur, 2017), although it was determined that the education beliefs of the pre-service teachers were based on the existentialist education philosophy, the philosophy of existentialism was adopted at least in the research of Tekin and Üstün (2008) and at medium-level in the research of Doğanay and Sari (2003). When the findings of the studies were examined, it was very important that the pre-service teachers adopted the principles of existentialism that reflects the current understanding of education. The philosophy of existentialism serves as an important roadmap for education systems aiming at transformation and equal opportunity in education.

According to the findings of this research, teacher identity of the pre-service teachers was found to be high. Teachers' perceptions of teacher identity as the basis of their beliefs as well as their educational beliefs directly affect instructional activities. In this respect, it can be stated that pre-service teachers feel themselves ready for the teaching profession and are motivated to do this profession. However, prospective teachers also think that they possess many of the cognitive and affective skills required by the teaching profession. Considering the literature, it has been determined that pre-service teachers from different grades and departments have positive/high teacher identity and proficiency belief (Akbulut, 2006; Aydin & Boz, 2010; Büyükduman, 2006; Diken, 2006; Erişen & Çeli köz, 2003; Gencer & Çakiroğlu, 2006; Gerçek, Yılmaz, Köseoğlu & Soran, 2006; Küçükyılmaz & Duban, 2006; Savran & Çakiroğlu, 2001; Uygur, 2010;Ulper & Bağcı, 2012; Yıldırım, 2011).
According to the findings, there was a significant positive relationship between education beliefs and teacher identities, except for essentialist belief. At this point, it can be stated that teacher identity of pre-service teachers are generally fed by philosophies that center the student and emphasize the individual differences of the student. In this context, it is possible that the intense and continuous emphasis on constructivism philosophy in education faculties creates significant differences in students' understanding. According to this philosophy, in order to prevent the student from having a passive identity in the learning environment, the teacher should offer choices in which the student can gain competence and can effectively participate in the learning process in line with the evolving tendencies of the teacher's identity rather than an authoritarian and disciplinary understanding.

It is seen that these principles, which are considered important in the context of contemporary philosophies, are considered by pre-service teachers as an important element of their teaching identity. Similar to the findings of this study, Altnkurt, Oğuz, and Yılmaz (2012) found that the dimensions in which teachers participated most were the dimensions of existentialism, progressivism, perennialism, re-constructionism, and essentialism, respectively.

As a result of the findings obtained from the research, the pre-service teachers' educational beliefs and teacher identities differed significantly according to gender (p < .05). It is seen that these differences are in favor of female pre-service teachers except for the essentialism philosophy. In line with these findings, it is noteworthy that female teacher candidates adopt contemporary educational philosophies more and male teacher candidates adopt stricter educational philosophies. Similar to the findings of the study, in the study conducted by Beytekin and Kadi (2015), a significant relationship was found between teacher education beliefs and value scores according to gender variable. Additionally, female teacher trainees' scores of progressivism, existentialism, and re-constructionism were higher than male teacher candidates' scores, but, for essentialist and perennialist beliefs, the situation is exactly the opposite. In the study, it was stated that the effect of factors may be in question such as home and previous school settings on the view of female pre-service teachers as a justification for the relevant situation.

In another study, Yılmaz and Tosun (2013) found that although the views of the participants related to progressivism and re-constructionism did not change according to gender, essentialist, perennialist, and existentialist beliefs changed according to gender. While male teachers had higher participation in perennialist and essentialist beliefs, female teachers had higher participation in existentialist education philosophy. In other words, male teachers adopt permanent and fundamentalist education philosophies that emphasize the characteristics of hard work, control, teacher centeredness, and preparation for life at a higher rate than female teachers. Accordingly, it can be said that male teachers advocate a more rigid educational process than female teachers. The fact those female teachers' opinions about existential education are more positive than male teachers can be considered as a parallel finding.

In the related literature, there is information that male teachers are more controlling, authoritarian, coercive, and aggressive than female teachers (Savran & Çağiroğlu, 2004; Zarembo & Fluck, 1995). In the study conducted by Oğuz, Altnkurt, Yılmaz, and Hatipoğlu (2014), a significant difference was found in educational beliefs of the teachers according to gender in favor of female teachers in the existentialist belief dimension. However, in spite of the findings obtained from this study, Çetin, İlhan, and Arslan (2012) found that gender was not an effective variable on the educational philosophies adopted by pre-service teachers.

According to the findings of this study, the pre-service teachers’ educational beliefs and teacher identities differed significantly according to the grade variable. Apart from essentialism, it was found that the difference was in favor of the upper classes. In parallel with the findings of the study, Ekiz (2005) compared the educational beliefs of the first and fourth year students and determined that the first year students adopted the philosophies of perennialism and essentialism more, and the fourth year students adopted the philosophies of progressivism and re-constructionism more.

Çetin, İlhan and Arslan (2012) found that grade variable had a statistically significant effect on the level of pre-service teachers’ adoption of traditional and contemporary educational philosophies. Unlike this study, Çakmak, Bulut, and Taşkıran (2016) did not find any significant difference in existentialism, progressivism, re-constructionism, and essentialism education beliefs according to grade variable. A significant difference was found between first with second grade, third grade and fourth grade in favor of first grade for the belief in perennialist education. In a study conducted by Biçer, Er, and Özel (2013), it was determined that while social studies pre-service teachers adopted the philosophy of perennialist education in the first years of the university, their beliefs in this philosophy of education decreased when they came to the last years.
Based on this finding, the fact that pre-service teachers are faced with the education environment in which essentialist and perennialist philosophy are kept at the forefront at secondary level can be considered as the reason behind the adoption of traditional educational philosophies in the first years of undergraduate education. However, the courses such as Classroom Management, Teaching Principles and Methods, Special Teaching Methods, Instructional Technologies and Material Design, Teaching Practice which are included in the third and fourth grade curriculum of undergraduate education and emphasize the necessity of contemporary philosophy help them adopt contemporary educational philosophies.

As a result of the findings obtained from this research, the pre-service teachers' educational beliefs and teacher identities differed significantly according to the department variable except for the re-constructivist and perennialist beliefs. In terms of educational beliefs, social studies and mathematics pre-service teachers adopted essentialist belief higher than pre-school pre-service teachers. In the progressivism and existentialism belief, pre-school pre-service teachers were higher than social studies and mathematics pre-service teachers.

Furthermore, it was determined that pre-school pre-service teachers had a higher level of teacher identity than social studies, mathematics, and classroom pre-service teachers. There are several reasons why pre-school and classroom pre-service teachers have a higher level of skill compared to other branches.

It can be thought that primary and especially pre-school curricula are convenient to use contemporary philosophies in terms of being flexible and convenient to use alternative methods and thus providing opportunities for teachers to make different decisions and implement them. At the same time, the interdisciplinary structure of the curriculums related to these branches provides the connection of subjects and achievements with many courses and thus the principles of contemporary philosophies are effective in the teaching process. In the context of assessment and evaluation, pre-school and classroom teachers can use more flexible and alternative methods (portfolio, and, so on.) than other branches. On the other hand, there is a more rigorous curriculum and measurement and evaluation process especially in mathematics and social studies. At the same time, all these factors develop pre-service teachers' identities, too. Köstekçi (2016) also have stated that classroom teachers who have the opportunity to interact with all students from the beginning of their education life more easily adopt an approach appropriate to the contemporary beliefs and offer more effective teaching.

According to the analysis, while the model was significant as a whole \[F(4,315)=23.971; \ p<.01\], progressivism educational belief (\(\beta = .254\)) was found out to be the most important dimension in the model that explained the teacher identity. These four variables, together, accounted for 23% of the change in teacher identity level of pre-service teachers. The relative order of importance of the dimensions in the regression model was seen as existentialism (\(\beta = .245\)) and perennialism (\(\beta = .159\)) educational beliefs. This suggests that teacher identity level of pre-service teachers is strongly explained by education beliefs such as progressivism, existentialism, perennialism, and re-constructivism. Especially, the fact that many elements of today's education system stem from the philosophy of progressivism and the emphasis on this philosophy in theoretical and practical processes in the faculties of education can be considered as the rationale of the model for predicting.

At this point, it can be suggested to create processes and learning environments that pre-service teachers can make reflections about their educational beliefs. thus, they will be aware of their educational beliefs and realize how these beliefs affect their decisions and actions in the educational process. Besides, the determination of pre-service teachers' and teachers' educational beliefs and their relationship with elements such as teacher identity, teacher effectiveness and teacher roles should be revealed with a deeper perspective.
